Wi-Fi

Range Extenders

Question

I have a Wi-Fi range extender, which boosts the network signal generated by my Wi-Fi router. I can connect my AiM device to the range extender by setting its Wi-Fi mode to "existing network", but the communication between my computer and AiM device doesn't work. Any ideas?

Answer

Please, avoid the use of range extenders, if at all possible. When your computer's Wi-Fi mode is working as an existing network (in order to get a connection on one pre-existing network), the AiM device should be directly connected to the Wi-Fi signal transmitted by the router.
